

# SBIR GRANT SUBMISSION PLAYBOOK

NASA · NSF · USTRANSCOM

**Prepared for: Alexander (Alex) Aguilar**

Sole Proprietor · Full-Stack Developer · Operations Technologist

Products: BlueLineOps Agent | AI Operations Chatterbot

April 2026

**What this document is:** A sequenced, step-by-step submission guide covering every prerequisite registration, pitch draft, and URL needed to successfully submit to NASA SBIR (Appendix A), NSF SBIR (Project Pitch), and USTRANSCOM CSO — ordered by priority and urgency. Read it front to back and complete each phase in order.

## Table of Contents

# PHASE 0 — Applicant Profile & Background

## Your Identity as a Principal Investigator (PI)

Every federal SBIR proposal requires a clear PI bio. Below is your pre-drafted profile based on your background. Copy this verbatim or adapt into each portal's bio field.

| Field               | Your Information                                      |
|---------------------|-------------------------------------------------------|
| Full Name           | Alexander (Alex) Aguilar                              |
| Role                | Sole Proprietor / Principal Investigator              |
| Business Name       | Alex Aguilar (Sole Proprietorship) — DBA: Alex Sysdev |
| Location            | Kansas City, MO                                       |
| Email               | xpertmarxman@gmail.com                                |
| Portfolio / Website | myportfolio-psi-tawny.vercel.app                      |
| GitHub              | github.com/alex-sysdev-dev                            |
| Primary Stack       | React, Node.js, TypeScript, PostgreSQL, AWS           |

## PI Biographical Sketch (Use in All Three Applications)

Alexander Aguilar is a Kansas City-based full-stack software developer and operations technologist with over a decade of hands-on experience in fulfillment, warehousing, and manufacturing operations. His unique background bridges the gap between industrial floor-level operations and modern software engineering, giving him rare domain expertise in the operational pain points that AI-driven systems must solve. He is an active freelance AI data annotator and evaluator across platforms including Outlier, Alignerr, and Mercor, with deep practical experience in LLM evaluation, agentic system design, and prompt engineering. As the developer of BlueLineOps — an agentic AI platform for warehouse operations — and an AI-powered conversational operations assistant (chatterbot), Aguilar brings both the technical depth and the domain credibility required to advance these innovations from prototype to production. He holds active projects on GitHub (github.com/alex-sysdev-dev) and maintains a professional portfolio at myportfolio-psi-tawny.vercel.app.

## PHASE 1 — Get Your EIN/TIN at IRS.gov

**Do this FIRST — before anything else.** Every submission below requires an EIN. It is free, instant, and takes under 10 minutes. You cannot register on SAM.gov without it.

### IRS EIN Application — Direct URL

<https://www.irs.gov/businesses/small-businesses-self-employed/get-an-employer-identification-number>

Reference / SS-4 Instructions: <https://www.irs.gov/instructions/iss4>

Sole Proprietor overview: <https://www.irs.gov/businesses/small-businesses-self-employed/sole-proprietorships>

### Step-by-Step: Getting Your EIN as a Sole Proprietor

**1**

**Go to  
IRS.g  
ov/EI  
N**

Open: <https://www.irs.gov/businesses/small-businesses-self-employed/get-an-employer-identification-number> — Click the blue 'Apply Online Now' button. The system is only available Mon–Fri 7am–10pm ET.

**2**

**Start  
the  
EIN A  
ssista  
nt**

Click 'Begin Application'. You will enter a multi-step online interview — no account required.

**3**

**Selec  
t  
Entity  
Type:  
Sole  
Propr  
ietor**

When asked 'What type of legal structure is applying?', select SOLE PROPRIETOR. Do NOT select LLC or Corporation — that costs money and adds complexity you don't need now.

**4**

**Reason for Applying**

Select 'Started a new business'. This is accurate — you are formalizing your freelance software development practice for federal contracting purposes.

**5**

**Enter Your Personal Information**

Line 1: Your legal name — Alexander Aguilar (not your business name). Line 2: Business/DBA name — 'Alex Sysdev' or leave blank. Enter your SSN as the responsible party (required — IRS must verify identity).

**6**

**Business Details**

Business start date: Use today's date or the date you began freelancing. Principal activity: Select 'Other' → type 'Software Development and R&D;'. Employees in next 12 months: Select 'None' (you are a sole prop with no W-2 employees).

**7**

**Review and Submit**

Review all entries carefully. Click Submit. The IRS will immediately display your EIN on screen.

**8**

**Save Your EIN — Critical**

PRINT or SCREENSHOT the confirmation page immediately. Your EIN format will be: XX-XXXXXXX. A CP 575 confirmation letter arrives by mail in 4–5 weeks, but you can use the EIN right away.

IMPORTANT (IRS Confirmed): As a sole proprietor, one EIN covers ALL of your businesses and products (BlueLineOps, chatterbot, future projects). You do NOT need a separate EIN per product. Source: IRS Publication 5845 / [irs.gov/businesses/small-businesses-self-employed/when-to-get-a-new-ein](https://irs.gov/businesses/small-businesses-self-employed/when-to-get-a-new-ein)

## PHASE 2 — SAM.gov Registration (All Three Require This)

SAM.gov (System for Award Management) is the federal contractor database. You must be registered here before NASA or USTRANSCOM will accept your submission. NSF also requires it before you can submit a full proposal (not the Project Pitch, but do it now).

| Step | Action                     | URL / Note                                                                     |
|------|----------------------------|--------------------------------------------------------------------------------|
| 1    | Create a Login.gov account | <a href="https://login.gov">https://login.gov</a> — Use your personal email    |
| 2    | Go to SAM.gov and sign in  | <a href="https://sam.gov">https://sam.gov</a>                                  |
| 3    | Click 'Register Entity'    | Select 'I am registering as an individual/sole proprietor'                     |
| 4    | Enter your EIN             | The EIN you just obtained from IRS.gov                                         |
| 5    | NAICS Code                 | Enter 541511 (Custom Computer Programming) or 541715 (R&D in Computer Science) |
| 6    | Enter banking info         | Required for payment — your personal checking account is fine                  |
| 7    | Submit and wait            | SAM registration takes 1–3 business days to activate                           |
| 8    | Record your CAGE Code      | Assigned automatically after activation — you'll need this for NASA            |

## PHASE 3 — SBIR Company Registry (Required for NSF)

The SBA SBIR Company Registry is separate from SAM.gov. NSF requires your SBC ID (Business Concern Control ID) in your Research.gov proposal. Register at:

<https://www.sbir.gov/registration>

After registering, you receive your SBC ID. This takes 1–2 business days. Complete this in parallel with SAM.gov during Phase 2.

# PHASE 4 — NASA SBIR Appendix A (DEADLINE: May 21, 2026)

**URGENT — Deadline: May 21, 2026 at 5:00 PM ET.** This is your most time-sensitive submission. Do your EIN and SAM.gov registration first, then come back to complete this. Submissions are made via NASA's ProSAMS portal. You are limited to 2 proposal packages total.

**NASA 2026 Info Hub:** [https://www.nasa.gov/sbir\\_sttr/nasa-sbir-sttr-program-program-year-2026-information-hub/](https://www.nasa.gov/sbir_sttr/nasa-sbir-sttr-program-program-year-2026-information-hub/)

**Phase I Solicitations (Live):** [https://www.nasa.gov/sbir\\_sttr/phase-i/](https://www.nasa.gov/sbir_sttr/phase-i/)

**ProSAMS Submission Portal:** <https://prosams.nasa.gov>

**Q&A; Hub (Questions due May 5):** [https://www.nasa.gov/sbir\\_sttr/2026-appendix-a-b-qa-hub/](https://www.nasa.gov/sbir_sttr/2026-appendix-a-b-qa-hub/)

**Help Desk Email:** [agency-sbir@mail.nasa.gov](mailto:agency-sbir@mail.nasa.gov)

## Best-Fit Subtopic for Your Technology

NASA's 2026 Appendix A includes subtopics under Autonomous Systems (TX10) and Human-Systems Integration. Based on the Appendix A and B released topics, the strongest match for your work is:

| Subtopic                                                                | Why It Fits Your Work                                                                                |
|-------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------|
| INSITU.1.S26B<br>Fault Management for Autonomous Systems                | BlueLineOps as an autonomous ops agent that detects, classifies, and resolves operational exceptions |
| EXPAND.3.S26B<br>Autonomous Onboard Health Mgmt for Distributed Systems | Your chatterbot/AI agent monitoring operational state across distributed warehouse nodes aligns with |

## NASA Proposal — BlueLineOps (INSITU.1.S26B)

**Project Title:** Autonomous Fault Detection and Resolution for Distributed Fulfillment Operations Using LLM-Based Agentic Systems

**Technical Abstract (250 words max — use verbatim or adapt)**

Current warehouse and fulfillment systems rely on rules-based software that fails silently when operational conditions deviate from programmed parameters. Human dispatchers serve as the primary fault detection mechanism — an expensive, error-prone, and unscalable approach. This research proposes the development of BlueLineOps, an LLM-powered agentic system designed to autonomously detect, classify, and resolve operational faults in distributed fulfillment environments. The system applies autonomous systems design principles — specifically fault management architectures proven in space systems — to terrestrial logistics infrastructure. Phase I will establish technical feasibility by: (1) developing a fault taxonomy for fulfillment operations analogous to space systems fault trees; (2) building and testing an LLM-based detection and response agent against a simulated multi-node fulfillment environment; and (3) measuring detection accuracy, time-to-resolution, and false-positive rates versus human-baseline benchmarks. The commercial application spans the \$250B U.S. third-party logistics market, where no AI-native fault management product currently exists. NASA mission benefit: the methodologies, algorithms, and software architecture developed will directly advance autonomous fault management capabilities applicable to distributed space systems and ground support infrastructure. Deliverables include a software prototype, benchmark dataset, and Phase II commercialization plan with identified pilot customers in the logistics sector.

Commercialization Plan (NASA Appendix A Requirement)

| Element               | Content                                                                                                                          |
|-----------------------|----------------------------------------------------------------------------------------------------------------------------------|
| Target Market         | U.S. third-party logistics (3PL) providers, DoD depot-level logistics, e-commerce fulfillment operators. TAM: 250B               |
| Phase I Milestone     | Working prototype + benchmark data demonstrating >80% fault detection accuracy vs. human baseline in simulation                  |
| Phase II Plan         | Production-ready platform with 2–3 paying pilot customers (3PL firms). Integration with existing WMS platforms                   |
| Phase III Path        | SaaS licensing model (\$500–\$2,000/mo per site). DoD sole-source contract via SBIR Phase III authority for space logistics      |
| Revenue Projection    | Phase II: 3 pilots at \$2K/mo = \$72K ARR. Phase III target: \$1M ARR within 24 months of commercialization                      |
| Competitive Advantage | Only AI-native fault management system built by a practitioner with direct ops floor experience. No existing AI-native solutions |

NASA WARNING: Do NOT use AI-generated content verbatim in your final submission. Reviewers are trained to detect it and it significantly reduces your score. Use this document to structure your thinking, then write the final submission in your own voice. The technical abstract above is a draft framework — personalize it with specific metrics and your actual prototype details.

## PHASE 5 — NSF SBIR Project Pitch (Submit After NASA)

**Status as of April 28, 2026:** NSF has temporarily paused new Project Pitch submissions due to the reauthorization lapse. As of April 16, NSF stated resumption is expected 'in the coming weeks.' Prepare your pitch now so you submit the day it reopens. Monitor: [sbir@nsf.gov](mailto:sbir@nsf.gov) for updates.

**Project Pitch Portal:** <https://seedfund.nsf.gov/project-pitch/>

**How It Works:** <https://seedfund.nsf.gov/apply/project-pitch/>

**Pitch Submission Guide:** <https://seedfund.nsf.gov/how-to-submit/project-pitch-guide/>

**Full Proposal Info:** <https://seedfund.nsf.gov/apply/full-proposal/>

**Solicitation NSF 24-579:**

<https://www.nsf.gov/funding/opportunities/sbirsttr-phase-i-nsf-small-business-innovation-research-small-business>

**NSF SBIR Contact:** [sbir@nsf.gov](mailto:sbir@nsf.gov)

**Tech Support:** [tip-ti-tech-support@nsf.gov](mailto:tip-ti-tech-support@nsf.gov)

### NSF Project Pitch — What They Actually Want

The NSF Project Pitch is a short online form (not a document upload) submitted through the MyWork Community portal. It covers three dimensions NSF scores on: (1) Intellectual/Technical Merit, (2) Broader Societal Impact, and (3) Commercial Potential. You get one pitch per submission window.

### NSF Project Pitch — AI Chatterbot (Recommended for NSF)

NSF is the better agency for the chatterbot because its mandate is science and engineering innovation with societal impact — not military applications. The chatterbot framed as an industrial workforce AI tool hits all three NSF criteria cleanly.

#### Project Title:

Domain-Adaptive Conversational AI for Industrial Operations: Enabling Human-Machine Collaboration in Blue-Collar Fulfillment Environments

#### Section 1 — Technical Innovation & Merit (200–300 words)

General-purpose large language models (LLMs) perform poorly in industrial operational contexts due to domain-specific terminology, high-stakes exception handling, and the need for real-time decision support under time pressure. Existing chatbot deployments in enterprise settings are designed for knowledge workers, leaving an estimated 80 million blue-collar workers in the U.S. without effective AI-assisted decision tools. This research investigates a novel approach: domain-adaptive fine-tuning of open-source LLMs on industrial operations corpora — specifically fulfillment, warehousing, and manufacturing — combined with a conversational interface optimized for low-literacy, high-urgency operational contexts. The core technical innovation is a Retrieval-Augmented Generation (RAG) architecture layered with operations-specific constraint engines that enforce SOPs, escalation rules, and safety protocols during inference. Technical risks include hallucination rate in high-stakes decisions, latency in time-critical environments, and vocabulary coverage across regional operational dialects. Phase I R&D; will quantify these risks through benchmark testing on a constructed industrial QA dataset and human-in-the-loop evaluation with experienced operations workers.

## Section 2 — Broader Societal Impact (150–200 words)

The U.S. logistics and manufacturing workforce faces an acute productivity gap driven by knowledge transfer failures, high supervisor-to-worker ratios, and the inability to scale expert judgment. New workers in fulfillment environments typically require 30–90 days to reach full productivity, largely because institutional knowledge is held by senior employees and not systematically accessible. This research addresses that gap directly: a domain-trained conversational AI that functions as an always-available operations assistant reduces onboarding time, decreases error rates, and creates a scalable mechanism for knowledge transfer. Broader impacts include workforce upskilling for economically disadvantaged workers, reduction of workplace safety incidents through real-time SOP guidance, and the development of a replicable AI adaptation methodology applicable across industrial sectors (healthcare, construction, agriculture). The PI's direct experience as a warehouse operations leader provides unique validation credibility for this research direction.

## Section 3 — Commercial Potential (150 words)

The target market is mid-to-large fulfillment operators (50–500 employees per site) in the U.S., representing approximately 15,000 facilities. A SaaS per-site licensing model at \$300–\$800/month yields a realistic Phase II TAM of \$54M–\$144M annually. Adjacent markets include fast-food/QSR operations, hospital logistics, and agricultural operations, each representing comparable TAMs. Phase I will validate market fit through structured interviews with 10+ warehouse operations managers and identify 2 pilot partners for Phase II. Competitive differentiation is strong: no existing product combines industrial domain tuning, SOP-constraint enforcement, and a workforce-appropriate interface. The PI's operational background provides direct customer access and credibility unavailable to purely technical founding teams.

## NSF Submission Steps (Once Portal Reopens)

1. Go to: <https://seedfund.nsf.gov/project-pitch/> — click 'Submit a Project Pitch'
2. Create an account on MyWork Community portal ([seedfund.nsf.gov](https://seedfund.nsf.gov))
3. Navigate to 'SBIR/STTR Project Pitches' → 'Submit New Project Pitch'
4. Fill in: Company name, EIN, brief description, technology area (select Computer Science/AI)

5. Enter the three sections above (Tech Merit, Broader Impact, Commercial Potential)
6. Submit — write down the case number displayed on confirmation
7. Expect NSF response within 3 weeks (invite or decline)
8. If invited: register on Research.gov and submit full Phase I proposal

NSF CRITICAL: You may only submit ONE Project Pitch at a time. While your BlueLineOps pitch could also work here, the chatterbot is recommended first because it better fits NSF's 'societal impact' mandate. Submit BlueLineOps to NASA. Submit chatterbot to NSF.

## PHASE 6 — USTRANSCOM CSO White Paper (Rolling Deadline)

**Rolling deadline — open until February 1, 2036.** No urgency, but submit after NASA. This is a contract opportunity (not a grant) that can lead to \$500K–\$5M awards. It targets logistics and IT solutions for the U.S. Transportation Command.

**Solicitation Number:** [HTC71126SCSO1](#)

**SAM.gov Listing:** <https://sam.gov> — Search solicitation number HTC71126SCSO1

**USTRANSCOM Business Page:** <https://www.ustranscom.mil/dbw/>

**Aol-902 Focus:** Transportation and Logistics Optimization

**Contact:** [transcom.scott.tcaq.mbx.tcaq-ds@mail.mil](mailto:transcom.scott.tcaq.mbx.tcaq-ds@mail.mil)

### USTRANSCOM Submission — What It Requires

USTRANSCOM CSO Phase I requires two deliverables submitted together: (1) a PowerPoint briefing and (2) a White Paper. The White Paper is the substantive document. Below is your drafted White Paper for BlueLineOps under Area of Interest 902 (Logistics Optimization).

### White Paper — BlueLineOps for USTRANSCOM Aol-902

#### 1. Executive Summary

BlueLineOps is an LLM-powered agentic operations platform designed to autonomously optimize logistics workflow execution, exception handling, and labor allocation in distributed fulfillment environments. Applied to USTRANSCOM's global mobility mission, BlueLineOps offers a commercial technology pathway to intelligent supply chain orchestration that reduces manual oversight requirements, accelerates exception resolution, and improves distribution capacity under surge conditions.

#### 2. Technical Approach

BlueLineOps employs a multi-agent LLM architecture where specialized agents handle distinct operational domains: inbound receiving, outbound fulfillment, labor routing, and exception management. Each agent operates within a constraint engine that enforces operational SOPs and escalation thresholds. Agents communicate via a shared operational state graph, enabling real-time coordination across distributed nodes. The system integrates via REST API with existing logistics management platforms, requiring no replacement of incumbent WMS infrastructure. Phase I will demonstrate a working prototype on simulated USTRANSCOM-analogous logistics scenarios, producing benchmark data on throughput improvement and exception resolution time.

#### 3. Relevance to USTRANSCOM Aol-902

USTRANSCOM's AoI-902 seeks solutions that optimize transportation and logistics operations, improve supply chain resilience, and enhance global distribution capabilities. BlueLineOps directly addresses all three objectives: autonomous workflow optimization reduces manual coordination overhead; exception detection and resolution improves resilience to disruption; and the multi-agent architecture scales horizontally across distributed distribution nodes consistent with USTRANSCOM's global footprint.

#### 4. Innovation and Differentiation

No existing commercial logistics platform combines LLM-native decision-making with operational SOP enforcement and multi-agent coordination. Current WMS systems are rules-based and brittle; BlueLineOps introduces adaptive, context-aware decision-making that improves over time. The PI brings unique dual expertise: 10+ years of warehouse operations leadership and full-stack AI/software development, providing domain validation unavailable in purely technical teams.

#### 5. Commercialization and Transition Path

Phase I: Prototype and benchmark (6 months). Phase II: Production platform with 2–3 commercial pilot customers in 3PL sector. Phase III (USTRANSCOM): Direct contract or OTA for deployment in USTRANSCOM logistics nodes, leveraging SBIR Phase III sole-source authority. Long-term: SaaS licensing to commercial logistics operators plus federal procurement channel through established USTRANSCOM relationship.

#### 6. PI Qualifications

Alexander Aguilar, Sole Proprietor. Full-stack software developer (React, Node.js, TypeScript, PostgreSQL, AWS) with 10+ years of warehouse/fulfillment operations leadership. Developer of BlueLineOps and AI operations chatterbot. Active AI/LLM researcher and evaluator. Portfolio: [myportfolio-psi-tawny.vercel.app](https://myportfolio-psi-tawny.vercel.app). GitHub: [github.com/alex-sysdev-dev](https://github.com/alex-sysdev-dev).

#### PowerPoint Briefing — Required Slides Outline

- Slide 1: Company Name, PI Name, Solution Title, Contact Info
- Slide 2: Problem Statement — The operational exception management gap in logistics
- Slide 3: Solution Overview — BlueLineOps architecture diagram
- Slide 4: Technology Approach — Multi-agent LLM system, constraint engine, API integration
- Slide 5: Relevance to USTRANSCOM AoI-902 — Direct mapping to each stated objective
- Slide 6: Competitive Landscape — Why existing WMS platforms don't solve this
- Slide 7: Phase I Plan — Prototype deliverables, timeline, metrics
- Slide 8: Commercialization — Phase II/III path, pricing model, transition strategy
- Slide 9: PI Qualifications — Bio, portfolio link, GitHub
- Slide 10: Budget Overview — Phase I cost estimate

# PHASE 7 — Master Checklist & Submission Order

Complete these in strict order. Items in earlier phases are prerequisites for later ones.

| #  | Action                                 | Where                                        | Deadline        | Status |

*This document is a working draft. All proposal sections should be personalized with your own voice and specific technical details before submission. The pitch narratives are frameworks — not final submissions. Always verify current requirements directly on each agency's portal before filing.*
